protoST at FAST, 15/10/2026 — English materials

English version of the materials for the protoST talk at the Fundación Argentina de Smalltalk. The Spanish originals in the parent folder are the reference; these files translate them without adding or removing content.

File	Translated from	Contents
`script.md`	`../guion.md`	Talk script: 30-minute core and optional modules up to 60 minutes
`hard-questions.md`	`../preguntas-dificiles.md`	Honest answers to the hard questions likely to come up
`talk-day-checklist.md`	`../checklist-dia-de-la-charla.md`	Checklist for the night before, the hour before and during the talk
`deck.html`	the published slide deck (`../deck.html` is the Spanish one)	The 17 slides with their speaker notes (`<aside>`), as a single HTML file in the Slides format
`speaker-notes.md`	`../notas-del-orador.md`	The speaker notes of every slide, extracted from `deck.html` (the slide PDFs carry none)

Shared with the Spanish version

The demos and the recordings are not duplicated; both versions use the same files:

- `../demos/` — `run_demo.sh`, `check_all.sh`, the four `.st` demos (demo 4 also has a Python `.feed`) and their expected outputs in `../demos/expected/`. The demo code, its comments and its output are already in English.
- `../recordings/` — terminal recordings of each demo, replayed with `scriptreplay` as the fallback if a live demo fails.

Paths in `script.md` and `talk-day-checklist.md` (for example `cd docs/talks/2026-10-15-fas/demos` or `../recordings/`) refer to those shared folders, exactly as in the Spanish version.

The figures come from three reports, named where each is used: `benchmarks/reports/2026-10-12-protocore-2.14.6.md` (protoCore 2.14.6 against 2.14.5 with the same protoST binary, and CPython: startup, the CPython comparisons, actors, demo 2, K5's memory), `benchmarks/reports/2026-10-12-adaptive-heap-default.md` (0.6.2 against 0.6.1: the adaptive heap controller) and `benchmarks/reports/2026-10-11-actor-regression-bisection.md` (the noise floor). They are copied as they appear there. Decimal commas in the Spanish text are written as decimal points here (for example 3,8× becomes 3.8×); no value was changed.
