Recorded fallbacks

Terminal recordings of each of the four demos, made with `script` (classic timing files) on 2026-10-12 against protoST 0.6.3 (the source tree's Release build of the release commit, GCC 15, protoCore 2.14.5), in the C locale so the lines `script` adds are in English. A browser was open, so the timings demo 2 shows are not idle figures (it printed a speedup of 4.5×). They are not part of the `.deb`; they live in the repository. Demo 2 was re-recorded on 2026-10-12 at 23:26 with the installed protoST 0.6.5 package on protoCore 2.14.6, on an idle machine in AC mode: one thread 694 ms, twelve actors 300 ms, speedup 2.3× (the idle median that evening was 2.4×, range 2.1–2.6×). Replay one with:

```
scriptreplay --timing=01-familiar-code.timing 01-familiar-code.typescript
```

Each ends with the `-- <demo>: verified` line printed by `run_demo.sh` after checking the output against `../demos/expected/`.
